1. Introduction

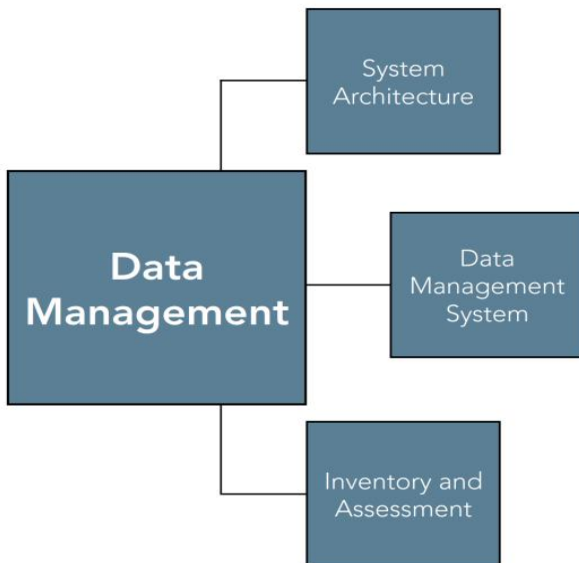

1.1 Project Overview

The City of Framingham retained BETA Group, Inc. (BETA) in May 2017 to provide Pavement Management Services using BETA’s Microsoft Access/ESRI-based Pavement Management Program (PMP). The PMP consists of approximately **224.5 public paved roadway miles**, and is one component of BETA’s dynamic Manage My Roads Platform as displayed on the right.

Framingham’s PMP serves as a data management tool that is utilized to maintain roadway conditions, perform analyses, and suggest appropriate roadway repairs. By combining professional engineering metrics with institutional knowledge, the City will be provided the necessary information to maintain and improve its roadway network.

BETA worked in conjunction with Framingham’s Department of Public Works (DPW) and refreshed the City’s PMP resulting in a Network Road Surface Rating (RSR) of approximately 75. The updated RSR was based on recent roadway improvements as well as confirming additional roadway conditions in the field.

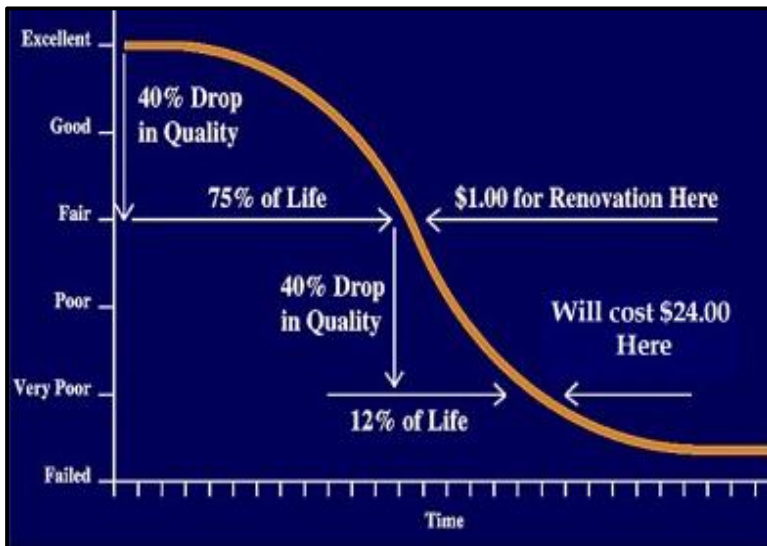

BETA and City staff met to identify the goals of the City with regard to maintaining roadway network conditions. Based on these discussions, it was clear that the City was committed to maintaining and improving its roadway network beyond the current RSR. The development of a multi- year Capital Improvement Plan (CIP) will assist the City in improving its network rating over time. The ultimate goal of the PMP is to serve as the foundation for decision making, by recommending cost effective and timely repair treatments to improve the City’s roadway network.

1.2 Pavement Management Approach

Pavement management is based on the theory of accurately predicting roadway deterioration over time. Performing timely maintenance to the roadway system prevents extensive future structural repairs. To establish and maintain an effective PMP, it is important for a community to understand the costs and effectiveness of different repair techniques and the proper timing of their execution.

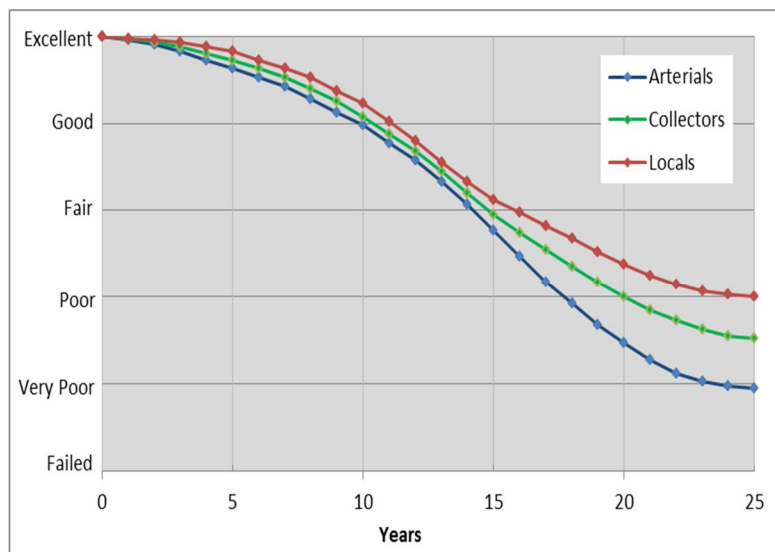

Figure 1.2.1: Standard Pavement Deterioration Curve

Source: Federal Highway

A key aspect of pavement management, as illustrated by the Pavement Deterioration Curve on the left, is the recognition that roadways are likely to deteriorate in an accelerated fashion at some point in a roadway's life. Understanding this concept and when to apply timely roadway improvement projects will ultimately yield the greatest return on investment.

Figure 1.2.2: Sample Pavement Deterioration Rates by Functional Class

As illustrated by the chart on the left, roadway functional classification typically affects how quickly a roadway will deteriorate. As a result, arterial and collector roadways depreciate at a more accelerated rate than local roadways. However, the rates are solely a theoretical model, demonstrating how roads are likely to deteriorate. Periodic inspections are recommended to consider other factors that can affect roadway deterioration (i.e. freeze/thaw cycles, truck traffic, sub surface utility maintenance, etc.). Ultimately, performance measuring is important to identify how pavement deterioration trends correspond with the model over time.

2. Repair Categories, Banding and Unit Pricing

2.1 Repair Categories and Banding

The PMP uses broad ranges to group the individual repair types into five major categories (refer to Table 2.1.1). Repair categories are a useful tool to summarize and further assess pavement condition data at the network level. Through an automated process, each individual road segment is assigned a repair method based on its specific RSR. The RSR value is derived from 0 to 100 (worst to best) set forth based on industry standards (i.e. severity and extent of the distresses present on the roadway segment). These distresses include: cracking (linear, alligator, edge), potholes, patching, roadway roughness, rutting, and drainage issues.

By categorizing roadways into repair bands, the program predicts appropriate repair types and estimated costs for each individual road based on RSR banding limits and unit cost. The table below provides a breakdown of Roadway Repair Categories and Banding.

Table 2.1.1: Roadway Repair Categories and Banding

<i>Repair Category</i>	<i>RSR Low Limit</i>	<i>RSR High Limit</i>	<i>Unit Cost per Square Yard (\$Y.)*</i>	<i>General Condition</i>
Structural Improvement	0	50	\$90.00	Very Poor
Rehabilitation	50	70	\$23.50	Poor
Preventative Maintenance	70	80	\$13.90	Fair
Routine Maintenance	80	92	\$1.00	Good
No Maintenance Required	92	100	\$0.00	Excellent

**Unit costs account for curb to curb improvements only; does not include any drainage, curbing, sidewalk, ADA, gravel sub-base or utility improvements.*

2.2 Repair Categories Defined

2.2.1 No Maintenance Required

No maintenance required indicates that a roadway is in excellent condition and does not need any repairs. Typically, these are roadways that have been treated within the past five years.

2.2.2 Routine Maintenance

An RSR falling between 80 and 92 signifies that routine maintenance may be recommended to preserve a roadway's lifespan. Crack sealing is a common treatment applied to help prevent further deterioration

as well as mill and fill spot repairs that treat isolated potholes or roadway conditions. These treatments are fairly inexpensive and help prolong the life of roadways.

2.2.3 Preventative Maintenance

Preventative maintenance treatments are utilized to help protect and seal pavement surfaces that are beginning to deteriorate. These treatments are generally much cheaper alternatives to rehabilitation and structural improvements, while extending the life of a roadway by roughly seven to 10 years. Repair treatments utilized within the City include rubberized chip seal with leveler course, bonded wearing course (with or without leveler course), and stress absorbing membrane interlayer (SAMI) with bonded wearing course.

2.2.4 Rehabilitation

Rehabilitation is the process of milling the existing pavement down (roughly 1"-2") and overlaying the base with a new surface. Although this practice is more costly than Preventative Maintenance, it adds approximately 12 to 15 years to the life expectancy of roadways. Mill and overlay with a leveler course is the primary rehabilitation treatment utilized by the City.

2.2.5 Structural Improvements

Structural Improvements warrant the highest cost treatment when it comes to roadway repair. Full depth reclamation (FDR) is the process of pulverizing existing asphalt to generate a new base material. Additives are sometimes introduced to help strengthen the base material before compaction and the application of a new surface course. Reconstruction is the complete removal of existing asphalt and bases to rebuild a roadway. 15 to 25 years of life is added to roadways that undergo these types of treatment.

3. Existing Conditions

3.1 City Maintained Pavement Conditions

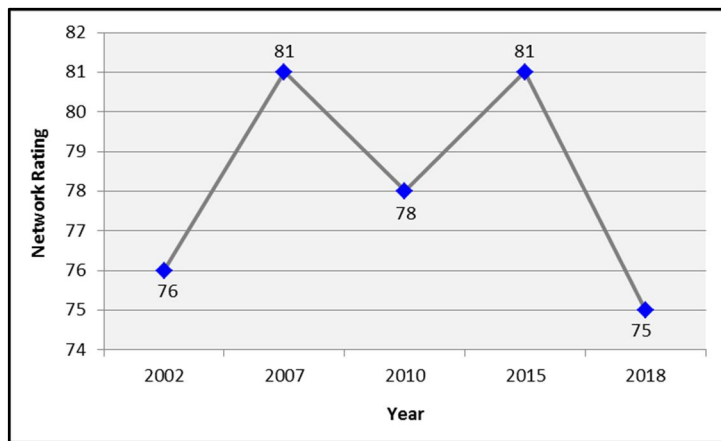

BETA updated the PMP in the summer of 2018, with the resulting network RSR scoring approximately a **75**. As previously mentioned, an RSR is assigned to each individual roadway segment by assessing surface distresses present on the roadway surface. Based on the severity and extent of each distress, the RSR assigned to each roadway segment ranges from 0-100 (worst to best). The weighted average based on the square yardage of all roadways generates the City’s network rating.

The following outlines how the network rating has varied over time.

Figure 3.1.1: Network RSR Change Over Time

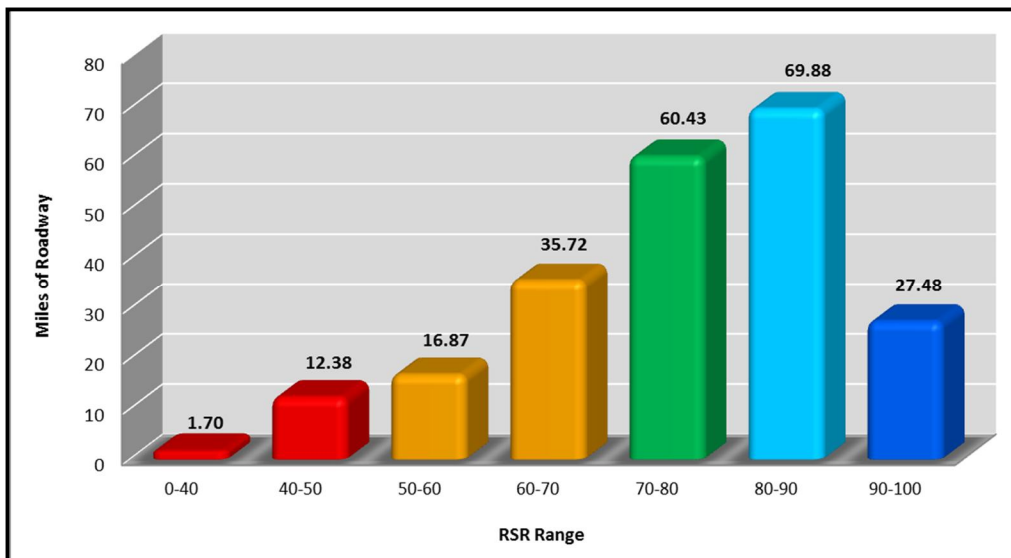

Year	Network Rating
2002	76
2007	81
2010	78
2015*	81
2018	75

*Most Recent Pavement Inspection Year

The following chart displays the distribution of roadway miles by RSR in groups of ten point increments. As the graphic below illustrates, over 130 road miles (58% of network) scored between a 70 and 90.

Figure 3.1.2: RSR Distribution

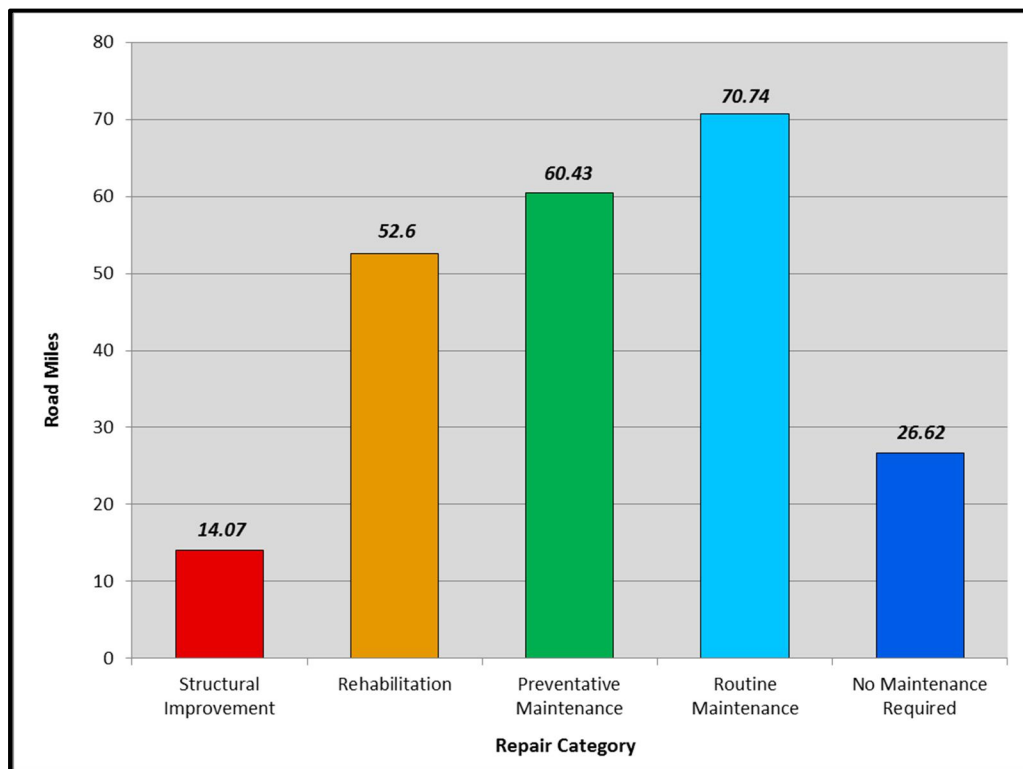

3.2 Repair Program and Backlog

After establishing the repair bands and unit costs for the roadway network, a backlog summary was generated which categorized each roadway into the five repair categories. The following table and figure provides the roadway miles and estimated costs associated with each repair category. As indicated, the network backlog is estimated at approximately \$55 million with the majority of roadways falling into the Routine and Preventative Maintenance categories. Refer to the RSR Map (36"x48") in the appendix for detailed RSR ratings for each individual roadway and corresponding repair categories.

Table 3.2.1: Roadway Backlog Summary

Repair Category	Length (Miles)	Square Yards	Percent Repair	Percent Cost	Unit Cost (per s.y.)	Estimated Cost
Structural Improvement	14.07	224,432	6.3%	36.9%	\$90.00	\$20,198,894
Rehabilitation	52.60	842,202	23.4%	36.2%	\$23.50	\$19,791,742
Preventative Maintenance	60.43	971,128	26.9%	24.7%	\$13.90	\$13,498,672
Routine Maintenance	70.74	1,196,290	31.5%	2.2%	\$1.00	\$1,196,290
No Maintenance Required	26.62	456,060	11.9%	0%	\$0.00	\$0
Total	224.47	3,690,111	100%	100%		\$54,685,598

Figure 3.2.1: Roadway Summary by Miles of Repair

The following charts expand on the Backlog Summary, further analyzing the data and presenting in terms of both miles and dollars of outstanding work.

Figure 3.2.2: Miles of Outstanding Work by Percentage

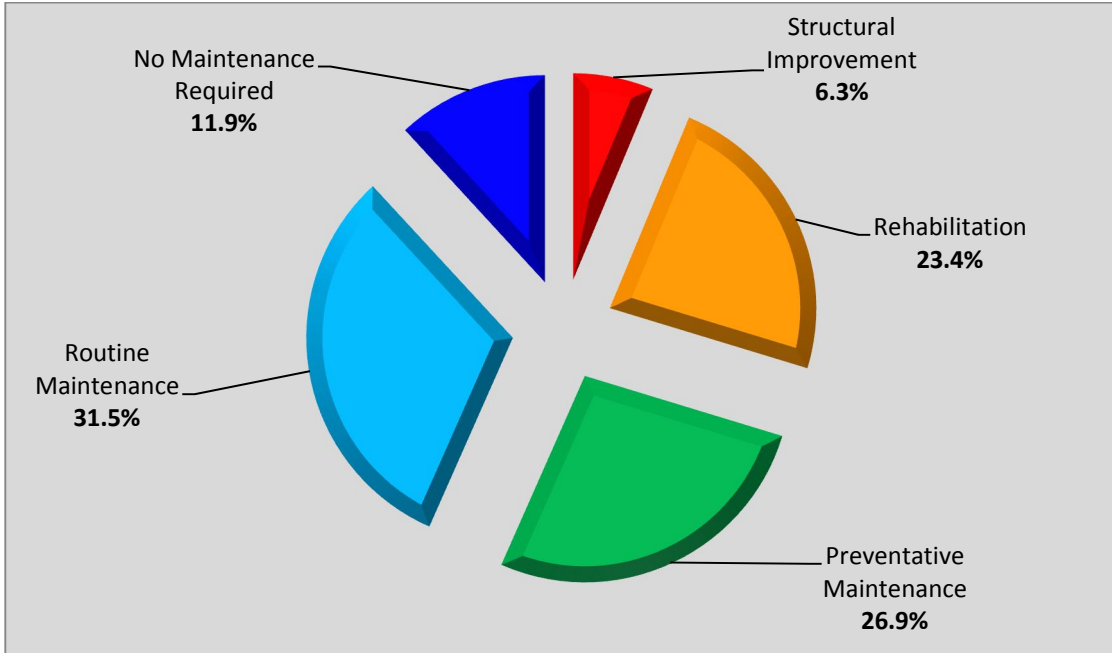

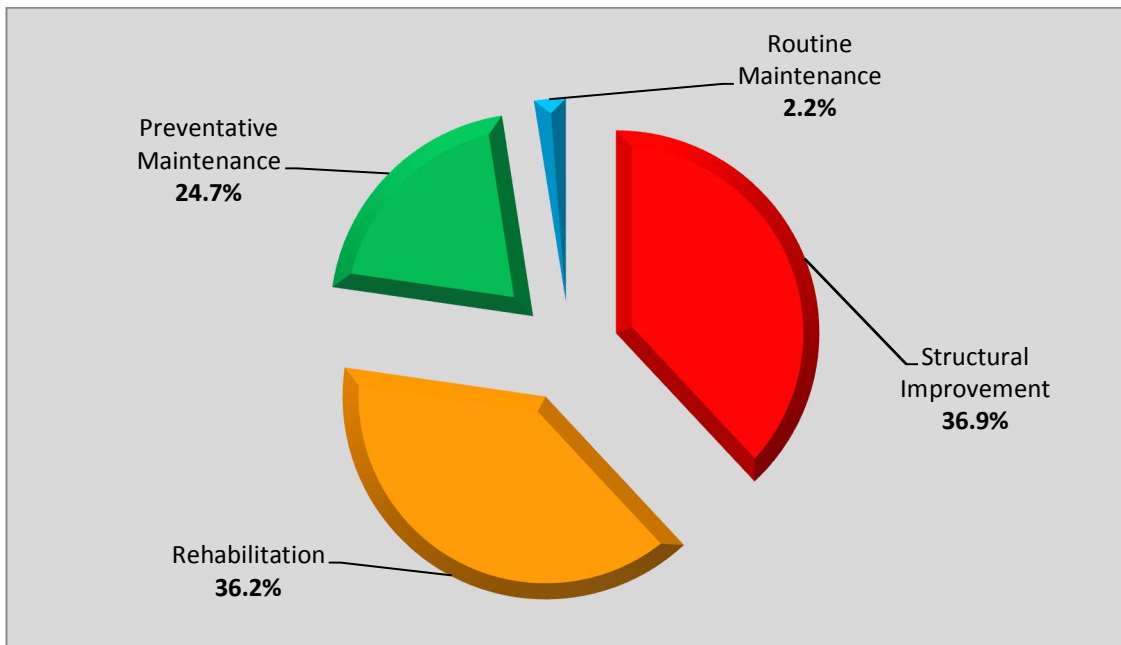

Figure 3.2.3: Dollars of Outstanding Work

Figures 3.2.2 and 3.2.3 illustrate that while only 6.3% of the roadway network falls within the structural improvement category, these roads account for roughly 37% of the outstanding backlog with respect to cost. Meanwhile, over half of the City’s road miles fall within the Routine and Preventative Maintenance categories (58.4%), which account for only 27% of the total backlog cost. Therefore, it is more efficient for the City to keep “good” roadways in respectable condition by extending their service life with both routine and preventative maintenance.

3.3 Functional Classification Analysis

Functional classification plays a significant role in terms of roadway importance to the community and prioritization. As mentioned earlier, functional classification plays a role in the likelihood of how a roadway will deteriorate over time. Roads such as arterials and collectors (roads with high traffic counts) are likely to deteriorate at a faster rate than local and cul-de-sac/dead end roadways.

A functional classification has been assigned to each roadway based on information established by MassDOT (MassGIS Roadway Centerline File). The Table below summarizes the road miles and percentages of each roadway functional class.

Table 3.3.1: Functional Classification Summary

Functional Classification	Road Miles	Percent of Network
Minor Arterial	10.69	4.76%
Major Collector	20.28	9.03%
Minor Collector	44.85	19.98%
Local	93.05	41.45%
Cul De Sac/Dead End	55.60	24.78%
Overall	224.47	100.0%

As the table above indicates, the majority of the roadways are classified as “Local” in nature (approximately 65%), while collector roadways represent approximately 30% of the roadway network.

The following figure and table display the average RSR and backlog for each functional classification.

Figure 3.3.1: Functional Classification Breakdown by RSR

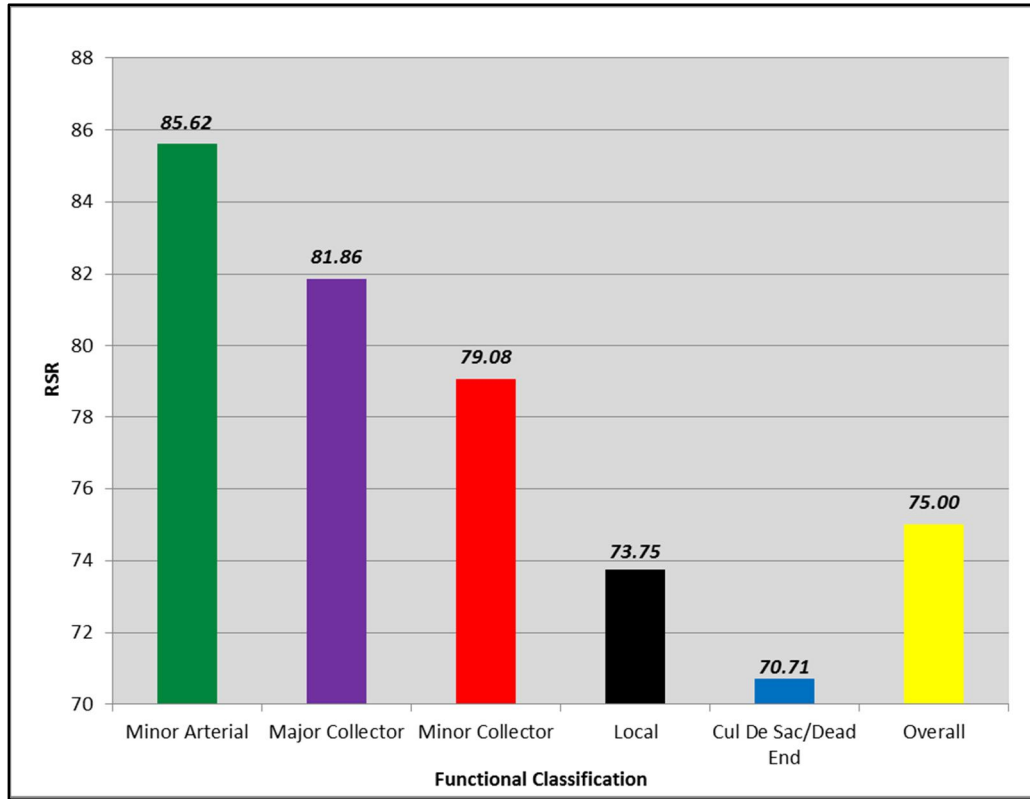

Table 3.3.2: Functional Classification Breakdown by RSR with Backlog

Functional Classification	Avg. RSR	Estimated Cost
Minor Arterial	85.62	\$713,290
Major Collector	81.86	\$2,709,221
Minor Collector	79.08	\$7,910,385
Local	73.75	\$26,140,204
Cul De Sac/Dead End	70.71	\$17,212,498
Overall	75	\$54,685,598

As presented above, the City has identified the importance of maintaining and preserving in very good condition its arterial and collector roadways (greater than 80 RSR).

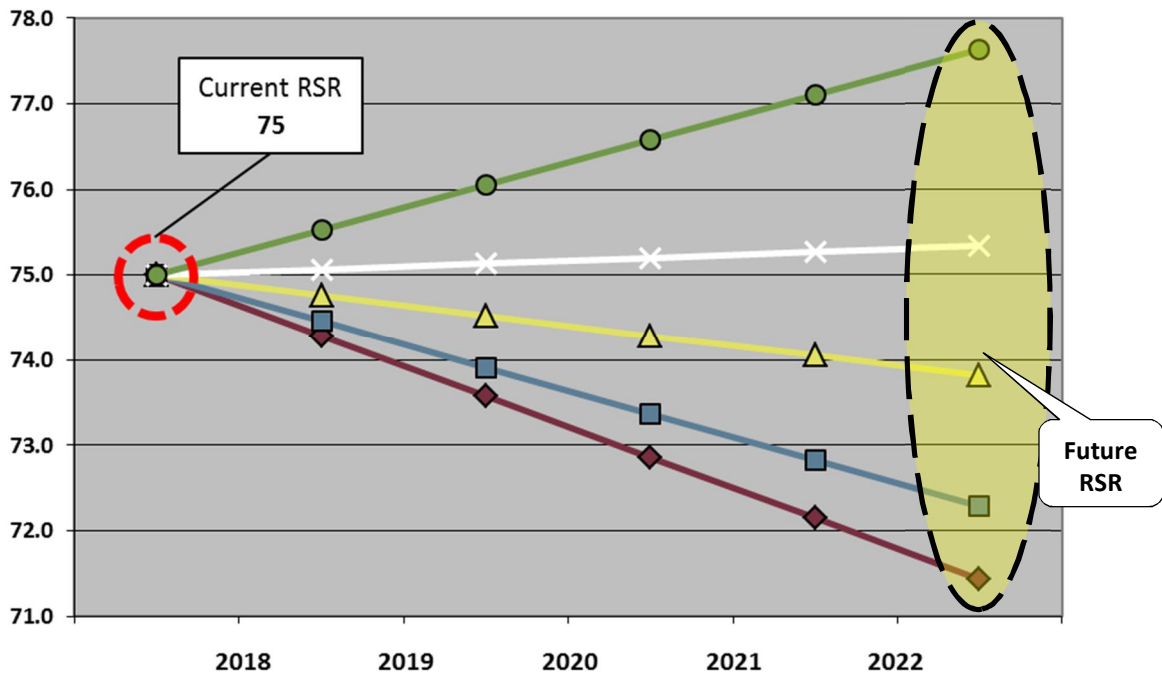

4. Roadway Forecasting Analysis

4.1 Overall Five-Year Forecast Model

As part of this effort, BETA analyzed five funding scenarios allotted towards roadway improvement projects over a five-year period. This effort focuses on predicting how the RSR projection will change over time by considering factors such as spending, road miles, square yards, and percentage of budget allotted to each repair method. For this model, a balanced approach was applied, allocating 10% of each funding scenario to Routine Maintenance, 20% to Preventative Maintenance, 40% to Rehabilitation, and 30% to Structural Improvements.

The following chart displays the Five Year Forecast Model for each of the five funding scenarios run for Framingham:

Figure 4.1.1: Five-Year Forecast Model

Funding Scenarios

Scenario 1*	\$1,884,948
Scenario 2	\$3,000,000
Scenario 3	\$5,000,000
Scenario 4	\$7,000,000
Scenario 5	\$10,000,000

*Approximate FY2019 Ch. 90 Allotment

**Unit costs account for curb to curb improvements only; does not include any drainage, curbing, sidewalk, ADA, gravel sub-base or utility improvements.*

The model suggests that Framingham should spend approximately **\$7.0 million** annually to maintain the current roadway rating. However, if the City were to spend \$10 million annually, the Network RSR is projected to improve over the next five years and approach 78. Conversely, if the City were to spend only the Chapter 90 allotment provided by the State on roadway improvement projects, the RSR is projected to rapidly decrease towards the lower 70's.

The following table further outlines the forecast model by analyzing the net change of the network RSR, as well as the total budget spent for each of the five forecast scenarios.

Table 4.1.1: 5 Year Forecast Model with Net Change and Total Dollars Spent

Funding Scenario	Current RSR	5 Year Projected RSR	Net Change	Total Dollars Spent
Scenario 1 (1.88M, FY19 Ch. 90)	74.90	71.34	-3.56	\$9,424,740
Scenario 2 (3.0 M)	74.90	72.19	-2.71	\$15,000,000
Scenario 3 (5.0 M)	74.90	73.71	-1.19	\$25,000,000
Scenario 4 (7.0 M)	74.90	75.24	0.34	\$35,000,000
Scenario 5 (10.0 M)	74.90	77.53	2.63	\$50,000,000

5. Concluding Remarks

Overall, the PMP will serve as a valuable tool to the Framingham Department of Public Works and will help to facilitate their progressive approach to managing roadway infrastructure. It is important to remember that the PMP is to be utilized for planning purposes only.

To best manage and update the City's PMP system, the following practices are suggested:

- Maintain the Paved Management Program (Database and GIS Centerline File).
- Add any new roadway network descriptions to the database as soon as the City accepts the roadways.
- Update repair type unit costs annually to provide accurate work plan forecasts.
- Undertake periodic road surveys to keep the system up to date to reflect current field conditions.
- Review developments in pavement technology that might offer a more cost effective alternative to pavement maintenance or rehabilitation over the pavement's life cycle.

APPENDIX

Framingham, Massachusetts

Roadway Status Summary

Roadway Type	Length (Miles)
Status: Accepted	
Asphalt	223.32
